Security Questions for New LTIs

INSTRUCTIONS: *The ITS Security team needs the following information to complete the security review of all new LTIs. Some of the following questions can be answered with the information provided on the LTI Intake form; however, you will need to reach out to the vendor's customer success manager to fully complete this form. Once completed, this form should be added as an attachment to the Application Add-On SNOW form.*

General

What is the application of the tool?

Blocks AI tools on a student's own computer only while a designated Brightspace quiz is open; restores them on submission.

What value does it bring to USC?

Lets instructors give open-note quizzes without AI, which the deployed Respondus LockDown Browser cannot do (it blocks all other apps, files and websites). No camera, microphone, screen or keystroke capture. No cost to USC for the pilot.

Third-Party Security Risk Management (TPSRM)

Has the vendor undergone TPSRM?

No. This is the first USC request; the developer will complete TPSRM as required.

What type of data (if any) is being stored by the vendor?

Brightspace user ID and name, random device ID, install status/version, quiz lock/unlock/tamper times, per-quiz access passwords. No quiz content, answers, grades, keystrokes, screen, camera, microphone or browsing history.

When was the last external security assessment conducted (i.e. do they have a SOC certification or something similar)?

None for LOCKqz itself (new tool, independent developer; no SOC 2). Hosting provider Cloudflare holds SOC 2 Type II. Source code available for review; HECVAT 4 attached.

When was their last security incident or compromise?

None.

Please describe it and any outcomes.

Not applicable: no security incidents or compromises.

Technical

Is this platform cloud hosted or on-prem?

Cloud-hosted backend (Cloudflare Pages, Workers, D1) plus a small helper app on the student's computer.

Do they leverage a public cloud provider?

Yes: Cloudflare (Pages, Workers, D1 database).

How Is data shared with this application?

LTI 1.3 launch and Names & Roles roster from Brightspace; the student app reports install status and quiz lock events over HTTPS; optional Valence API (OAuth 2.0) only to set quiz passwords.

How is data protected during transmission and at rest?

TLS (HTTPS) in transit; D1 data encrypted at rest with AES-256. The local helper listens only on 127.0.0.1 and requires a token.

How is authentication and authorization handled by the integration?

LTI 1.3 OIDC launch with signed JWTs verified against USC's Brightspace keys; instructors see only their own courses; quiz passwords are released only to a device that has confirmed its lock.
